

A 22-megabyte home page that mobile can't load

Source: Google Lighthouse (the engine behind PageSpeed Insights) — seatofthesoul.com home page, Jun 25, 2026.
Full reports: [Mobile](#) · [Desktop](#). Reproducible at pagespeed.web.dev.

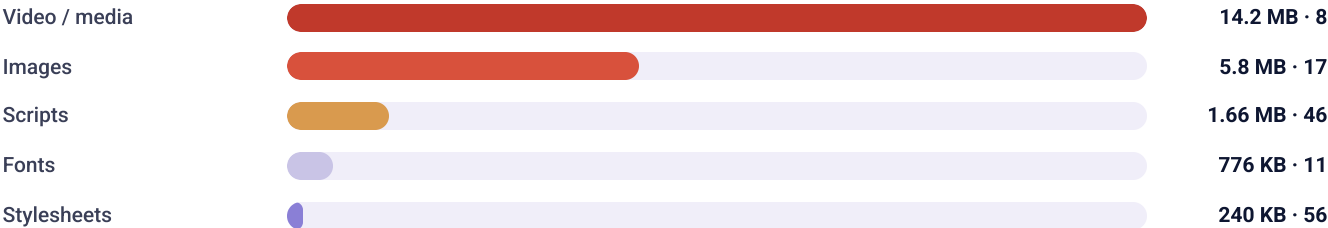

The home page ships **22.7 MB** across **146 requests**, and takes **18.5 seconds** to show its main content on a phone. On desktop it scores an acceptable 89, but because **56% of visitors are on mobile** (see the Analytics brief), the slow mobile experience is what most people actually get — and the Core Web Vitals Google uses for ranking **fail** there.

Why the page is this heavy

- ↓ **Video dominates the page.** **14.2 MB** of video (8 files) auto-load — nearly two-thirds of the entire page weight.
- ↓ **Images aren't optimized.** **5.8 MB** of images; modern formats (WebP/AVIF) and right-sizing would save **~3.9 MB**.
- ↓ **Too many files.** **56** stylesheets and **46** scripts load for one page — the hallmark of a plugin-heavy WordPress build.
- ↓ **Render-blocking resources.** CSS/JS in the way of first paint cost an estimated **2.3s** before anything useful appears.
- ↓ **Legacy code & weak caching.** **~76 KB** of legacy JavaScript is shipped, and better caching could save another **~167 KB**.
- ↓ **Third-party load.** **1.6 MB** across 27 third-party requests — each one outside your control and a point of failure.

WHERE THE 22.7 MB GOES — HOME PAGE WEIGHT BY RESOURCE TYPE (MOBILE)

Lab data from Google Lighthouse 12.8.2 (Slow-4G, emulated mobile), seatofthesoul.com home page, Jun 25, 2026. Page weight is total transfer size; "savings" are Lighthouse estimates. Anyone can reproduce these results at pagespeed.web.dev. Prepared by 22D Marketing for The Seat of the Soul Institute · June 2026.

Failing the metrics Google ranks on

Core Web Vitals are the user-experience signals Google uses for search ranking. Mobile lab values, Lighthouse, Jun 25, 2026.

CORE WEB VITALS — CURRENT MOBILE VALUE VS. GOOGLE'S "GOOD" THRESHOLD

LCP · main content		18.5s / 2.5s
Speed Index		15.0s / 3.4s
First Contentful Paint		3.2s / 1.8s
Total Blocking Time		320ms / 200ms
Cumulative Layout Shift		0 / 0.10 ✓

Four of five Core Web Vitals fail on mobile — including **LCP**, the metric Google weights most heavily. Only layout stability (CLS) is in range: the page is visually steady, but agonizingly slow to appear.

What the rebuild targets

- ✓ **Right-sized, lazy media.** Replace 14.2MB of auto-loading video with a poster + click-to-play, compressed stream — the single biggest win.
- ✓ **Modern images.** WebP/AVIF + correct sizing recovers ~5.2MB and sharpens quality on every device.
- ✓ **One platform, not 100 files.** Webflow ships lean CSS/JS — no plugin pile-up of 56 stylesheets and 46 scripts.
- ✓ **Targets that pass.** Engineering goals: **LCP < 2.5s, page < 3MB**, validated on the live build before go-live.
- ✓ **Managed CDN & caching.** Global delivery and long-cache assets included — no hosting tuning to maintain.
- ✓ **Faster pages rank higher.** Passing Core Web Vitals lifts the same SEO the Analytics brief shows is your best-engaging channel.
